

12 Volt relay (fused)

- Red wire is number 35 on relay and goes direct to battery 12v.
- Black wire is number 85 and that goes to a ground. (clean metal surface with no paint).
- Blue wire is number 87 and that goes to the intercooler pump. Rule pump, or Davies Craig 150.
- White wire is number 86 and that is your trigger wire. That will be wired to a 12v key on with a optional switch in between. This will turn the pump on with the car runing. If used at drag strip, its recommended to use a switch in between to keep the ice water from flowing until after you do your burnout. Then you will have the coldest water right when needed during the pass.
