99-04 Lethal Performance Dual Relays Return Style Wire Harness Installation Instructions

Starting from the rear of the car you’re going to access the FPDM (fuel pump driver module) behind the trunk liner on the drivers side of the car.

Once you have access to the FPDM you’re going to pull back the loom from the FPDM connector so the wires are visible. If you have a GT/Mach-1/99-01 Cobra the wire you’re looking for is pink/black wire. For 03-04 cobra’s you’re going to look for the green/yellow wire, (05-09 GT/GT500) the violet wire , (2010+ GT/GT500) the Violet with Green tracer wire (2011-2013 GT/Boss).

You’re going to cut that wire about 4” from the FPDM connector. The wire that’s still hanging from the connector is left along. The other piece of that wire which leads back to the PCM you’re going to crimp onto the BLUE wires from the relays. Make sure to heat shrink the connection.

After take the BLACK ground wires from the relays that have the ring terminal on them and ground them to the chassis at the same location the FPDM is ground.

Mount the relays in the area around the FPDM with some self tapping screws.

Once the relays have been mounted run wires with the 6 pin connector on the end of them to the fuel hat assembly. You can run the wires along the back of the trunk and under the carpet to the grommet located above the fuel tank. It’s easiest to pull the grommet up first and cut it with a blade in order to pass the wire with connector through it. Once the wires are passed through to the underside of the car you’ll plug the 6 pin connector into the DivisionX fuel hat. If you’re using this harness with an older model hat which doesn’t have the 6 pin connector on it you can cut the 6 pin connector off of the harness and wire the harness directly to the wires on the hat. The (2) BLACK larger black wires go to the BLACK ground wires on the fuel hat. The ORANGE and GREEN power wires on the harness to each red wire on the hat which is power to the pumps.

We recommend you solder and heat shrink the connections for each pump. Make sure that you use extreme caution soldering around the fuel tank as you do not want to cause any sparks or open flames close to gasoline. We recommend doing this work before the fuel hat is installed and away from the tank.
The last part of the installation will be running the RED power wires from the relays to the battery. You can run these wires on the drivers side under the back seat carpet and door sill plates all the way to the front of the car. You’ll then pass these wires through the grommet located on the firewall by the steering shaft. Continue routing these wires up the drivers side to the battery. Solder and heat shrink the fusible link with the ring terminal on it to the (2) RED power wires. Then attach the fusible link with the ring terminal on it to the positive lug on the power distribution box.

When installed correctly the pumps will run when the car is keyed on. When the car is keyed off the pumps will stop running.

LEVEL SENDER WIRES

On the wire harness where the 6 pin connector meets the fuel hat you’ll see (2) short wires with butt connectors crimped onto them. Those are for the level sender. You’re going to connect the YELLOW wire on the Lethal Harness to the YELLOW wire on the stock wiring harness. Then connect the BLACK or PURPLE wire on the Lethal Harness to the BLACK/ORANGE wire on the stock wiring harness.
